Chapter 1 <Introduction>

1.1 <Product Overview>

LE-363 is the 3.5 inches embedded motherboard with AMD Geode GX533 platform, with onboard VGA, AC97 audio, dual LAN and DC 12V input interface. Based on the AMD Geode GX533 processor, the board provides many advanced features for reduced power consumption, fanless design and high cost/price rate of production.

Low Power Consumption

Based on the AMD Geode GX533@400MHz processor onboard, it only takes up to 8.4W at maximum powering, and is completely suitable for fanless design. Without any cooling fan onboard, it can avoid the heat problem when the cooler failed in accidence.

Onboard TTL/LVDS LCD interface

Based on the AMD Geode GX533@400Mhz of integrated graphics, the board provides onboard graphics with up to 4/8/12/16 MB of frame buffer, 18-bit/24-bit LVDS and 24-bit TTL interfaces.

Embedded Component

Due to the low profile design, the board provides PCMICA card Bus, CF card socket for flash disk with porting embedded OS and up to 512MB of DDR SO-DIMM.

Single Voltage Input

The board only requires DC 12V input; user's can easily connect the board with an adapter without the huge power supply.

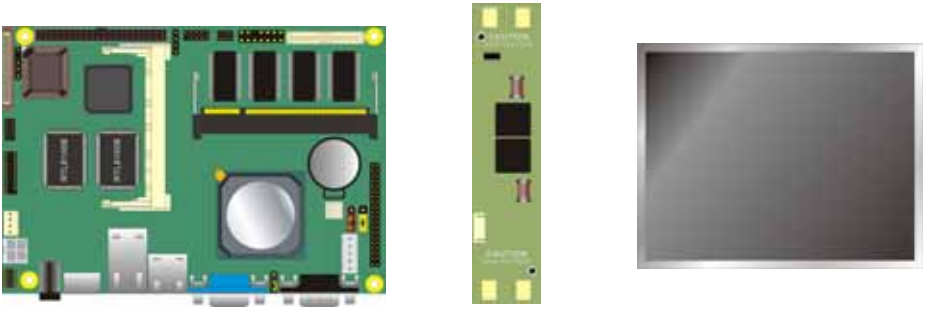
To setup the LCD, you need the component below:

1. A panel (support up to 18-bit/24-bit color) with TTL or LVDS interfaces.
2. An inverter for panel's backlight power.
3. A LCD cable and an inverter cable.

For the cables, please follow the pin assignment of the connector to make a cable, because every panel has its own pin assignment, so we do not provide a standard cable; please find a local cable manufacture to make cables.

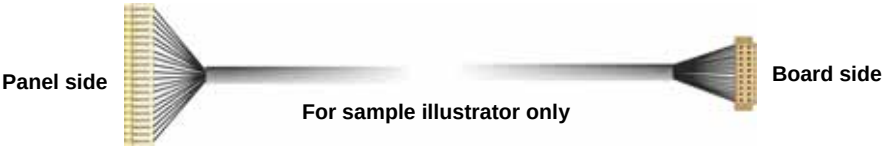
LCD Installation Guide:

1. Preparing the **LE-363**, **LCD panel** and the **backlight inverter**.

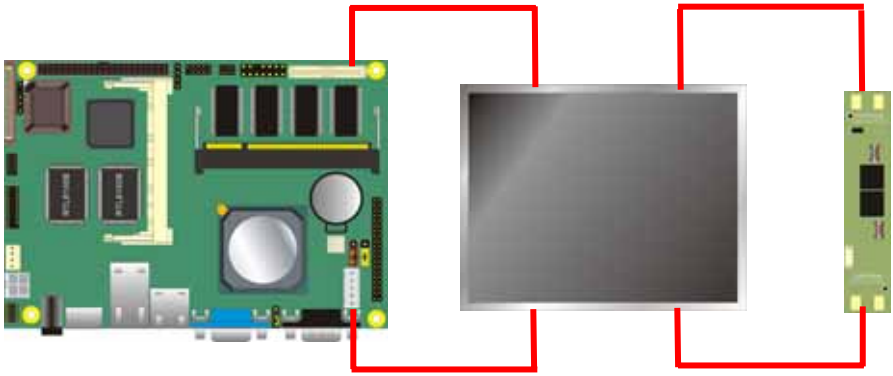


2. Please check the datasheet of the panel to see the voltage of the panel, and set the jumper **JVLCD** to +5V or +3.3V.
3. If your panel is for TTL interface, you would need a TTL type cable.

4. IF your panel is for LVDS interface, you would need a LVDS type cable.



5. To connect all of the devices well.



After hardware setup well, you need to select the panel type in the BIOS.

Chapter 3 <BIOS Setup>

The single board computer uses the Award BIOS for the system configuration. The Award BIOS in the single board computer is a customized version of the industrial standard BIOS for IBM PC AT-compatible computers. It supports Intel x86 and compatible CPU architecture based processors and computers. The BIOS provides critical low-level support for the system central processing, memory and I/O sub-systems.

The BIOS setup program of the single board computer let the customers modify the basic configuration setting. The settings are stored in a dedicated battery-backed memory, NVRAM, retains the information when the power is turned off. If the battery runs out of the power, then the settings of BIOS will come back to the default setting. The BIOS section of the manual is subject to change without notice and is provided here for reference purpose only. The settings and configurations of the BIOS are current at the time of print, and therefore they may not be exactly the same as that displayed on your screen.

To activate CMOS Setup program, press ＜DEL＞ key immediately after you turn on the system. The following message "Press DEL to enter SETUP" should appear in the lower left hand corner of your screen. When you enter the CMOS Setup Utility, the Main Menu will be displayed as **Figure 3-1**. You can use arrow keys to select your function, press ＜Enter＞ key to accept the selection and enter the sub-menu.

Appendix D <Programming GPIO's>

The GPIO can be programmed with the MSDOS debug program using simple IN/OUT commands. The following lines show an example how to do this.

```
GPIO0...GPIO7    bit0……bit7
-o 4E 87                    ;enter configuration
-o 4E 87
-o 4E 2A
-o 4F FD                    ;enable GPIO function
-o 4E 07
-o 4F 07                    ;enable GPIO configuration
-o 4E F0
-o 4F xx                    ;set GPIO as input/output; set '1' for input,'0'for output
-o 4E F1
-o 4F xx                    ;if set GPIO's as output, in this register its value can be set

Optional :
-o 4E F2
-o 4F xx                  ; Data inversion register ; '1' inverts the current value of the
                            bits ,'0' leaves them as they are
-o 4E 30
-o 4F 01                  ; active GPIO's
```

Appendix E <Programming Watchdog Timer >

The watchdog timer makes the system auto-reset while it stops to work for a period. The integrated watchdog timer can be setup as system reset mode by program.

Timeout Value Range

- 1 to 255
- Second or Minute

Program Sample

Watchdog timer setup as system reset with 5 second of timeout

```
-o 4E 87          ;enter configuration
-o 4E 87
-o 4E 07
-o 4F 08          ;enter Logical Device 8
-o 4E F5
-o 4F 00          ;set as Second* Minute: bit 3 = 0; Second: bit 3 = 1
-o 4E F6
-o 4F 05          ;set as 5 Second
```
